

## EAS WYSIWYG Editor

Any information system has a requirement for the easy creation of display pages. The EAS system uses the world standard page format html which many people are familiar with.

The WYSIWYG (What You See Is What You Get) editor allows the exact placement of text, photographs, video and television objects anywhere within the display page by simply dragging them around the edit area with the mouse.

The editor offers easy selection of background images, photographs, video and text. A solid outline or dashed borders can be added to the display objects and photographs can either keep the correct aspect ratio or be stretched to fit within a defined space. Options to make photographs or video full screen are available.

Offering the user a full WYSIWYG editing environment the user is free to drag text and images around the screen and place them exactly where they are required. The editor offers horizontal and vertical snap to grid features and can display a layout grid to aid the positioning of page objects.

The editor can show you if the bottom part of your display pages will be obscured by the scrolling ticker messages that the system can display on the noticeboard screens.

As our NDDTV unit can display television, the output of a DVD player or Video/CCTV camera, the editor allows a TV object\* to be placed anywhere in the screen area with it's size being easily adjusted with the mouse. Additionally, the TV object location can be defined in the editor page setup so it will appear in the same place in all new display pages.

Full font size, type and colour are selectable along with left, right and centre justification. Pages can have a background image quickly selected from a list of Thumbnails and photographs / images can be easily imported from outside the system directory structure. Full text search is provided to locate text within any pages created with the editor. The editor and Page Server can work from a shared network drive on a central server, used as a multi-user media source.
